BOARD FLOORPLAN

ERRATA

The design kit errata refer to two different PC board revisions: the DS26502DK01A0 and DS26502DK01B0. The PC board revision code is found on the bottom of the board in the lower right corner.

DS26502DK01A0 Circuit Boards

- RCLK did not get connected to FPGA. A jumper wire was run from RCLK to TP10 to provide the connection.
- Silkscreen for J3.4 is incorrect. Silkscreen reads “JTDIMMC2107” and should read “JTDOMMC2107.”
- RJ45 connector J4 does not use the standard pin numbers for connection to the transformer (and subsequently to TTIP/TRING and RTIP/RRING). This connector has been left unpopulated to avoid confusion. The schematic has been updated and is correct.
- DC blocking capacitor C4 on TTIP too small. A 10 μ F capacitor is recommended; a 1 μ F capacitor was populated.

DS26502DK01B0 Circuit Boards

- RJ45 connector J4 does not use the standard pin numbers for connection to the transformer (and subsequently to TTIP/TRING and RTIP/RRING). This connector has been left unpopulated to avoid confusion. The schematic has been updated and is correct.

ADDITIONS

The following signals have been connected to test points via the FPGA:

- TP6 is driven with data present at the TS_8K_4 pin of the DS26504.
- TP7 is driven with the 400Hz signal mentioned in the TS_8Ksrc register (page 15).
- TP8 is driven with the 8KHz signal mentioned in the TS_8Ksrc register (page 15).

BASIC OPERATION

This design kit relies upon several supporting files, which are available for downloading on our website at www.maxim-ic.com/telecom. See the DS26504DK QuickView data sheet for these files.

Hardware Configuration

- Supply 3.3V to the banana-plug receptacles marked GND and VCC_3.3V.
- DIP switches are unused and can be in either the ON or OFF position with exception for the Flash programming switch, which should be OFF.
- From the Programs menu, launch the host application named ChipView.exe. Run the ChipView application. If the default installation options were used, click the Start button on the Windows toolbar and select Programs → ChipView → ChipView.

General

- Upon power-up the RLOS and RLOF LEDs (red) will be lit, the INT LED (red) will not be lit, and Status LED (DS10 red/green bicolor) will be green.

Quick Setup (Register View)

- The PC will load ChipView offering a choice among DEMO MODE, REGISTER VIEW, and TERMINAL MODE. Select Register View.
- The program will then request a definition file. Select DS26504DC_FPGA.def. Through the 'links' section, this will also load DS26504.def.
- The Register View Screen will appear, showing the register names, acronyms, and values for the DS26504.
- Predefined Register settings for several functions are available as initialization files.
 - ini files are loaded by selecting the menu File→Reg ini File→Load ini File.
 - Load the ini file "CompositeClock.ini."
 - Load the ini file "DS26502FPGA_2048Clks.ini," which sets the DS26504 in Intel nonmultiplexed mode with MCLK driven at 2.048MHz.
 - After loading the ini files the following may be observed:
 - The RLOS and RLOF LEDs extinguishes upon external loopback.
 - The part begins operating in composite clock mode.

Miscellaneous

- Clock frequencies and certain pin bias levels are provided by a register-mapped FPGA.
- The definition file for this FPGA is named DS26504DC_FPGA.def. [Table 2](#) shows the FPGA register definitions. A drop-down menu on the top of the screen allows for switching between definition files.
- All files referenced above are available for download as described in the section marked "BASIC OPERATION."

ADDRESS MAP

Device address space (DS26504 and FPGA) begins at 0x81000000.

All offsets given below are relative to the beginning of the device address space (shown above).

FPGA Control Registers

The FPGA register set consists of two types of registers: level setting and clock multiplexing. There are 10 registers for tri-state and level-control setting when in hardware mode. The level-setting registers are only valid when the DS26504 is in hardware mode (BIS1:0 = 11). When in nonhardware mode, the FPGA pins affected by the level registers are automatically either tri-stated, or assume an alternate function (e.g., they function as address databus pins or SPI pins). Exceptions are given with the register descriptions.

NOTE: THE DS26502DK01A0 CIRCUIT BOARDS USED A 1UF CAPACITOR (REFERENCE DESIGNATOR C4)FOR DC BLOCKING ON THE TTIP PIN. THIS HAS BEEN INCREASED TO 10UF ON THE DS26502DK01B0 CIRCUIT BOARDS

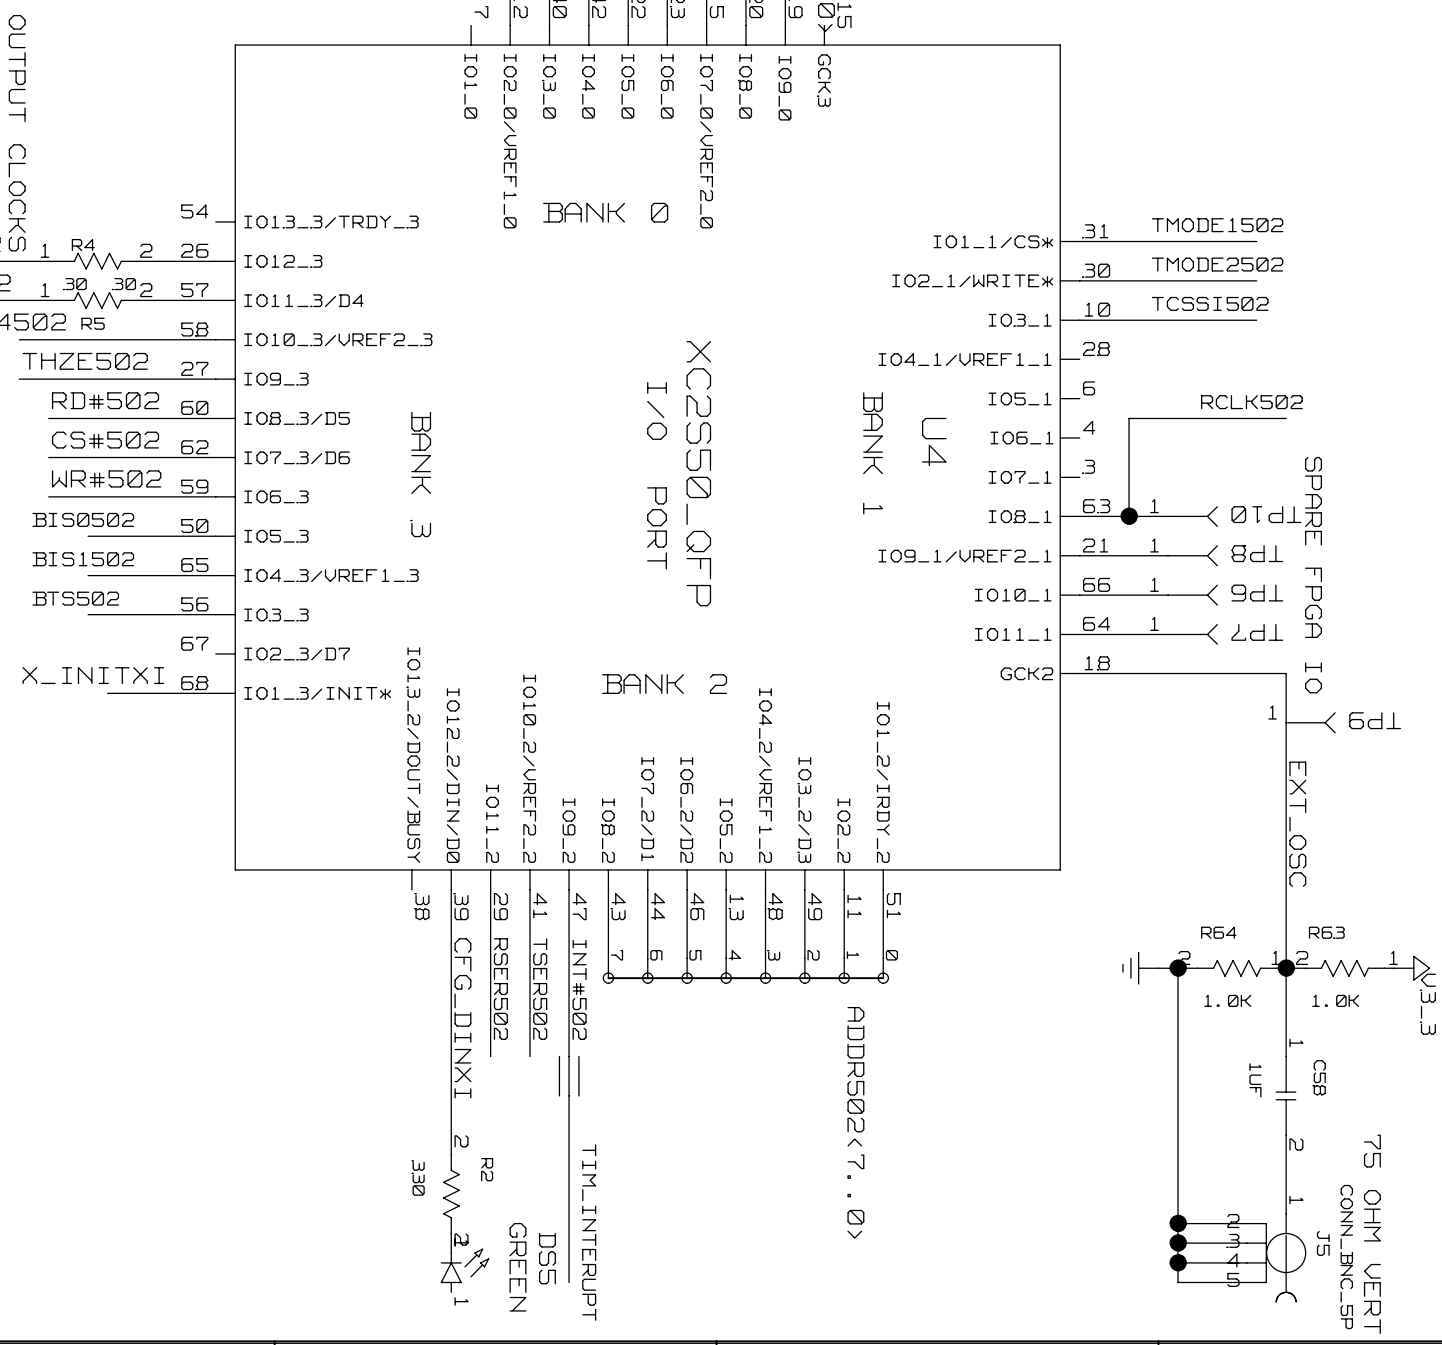

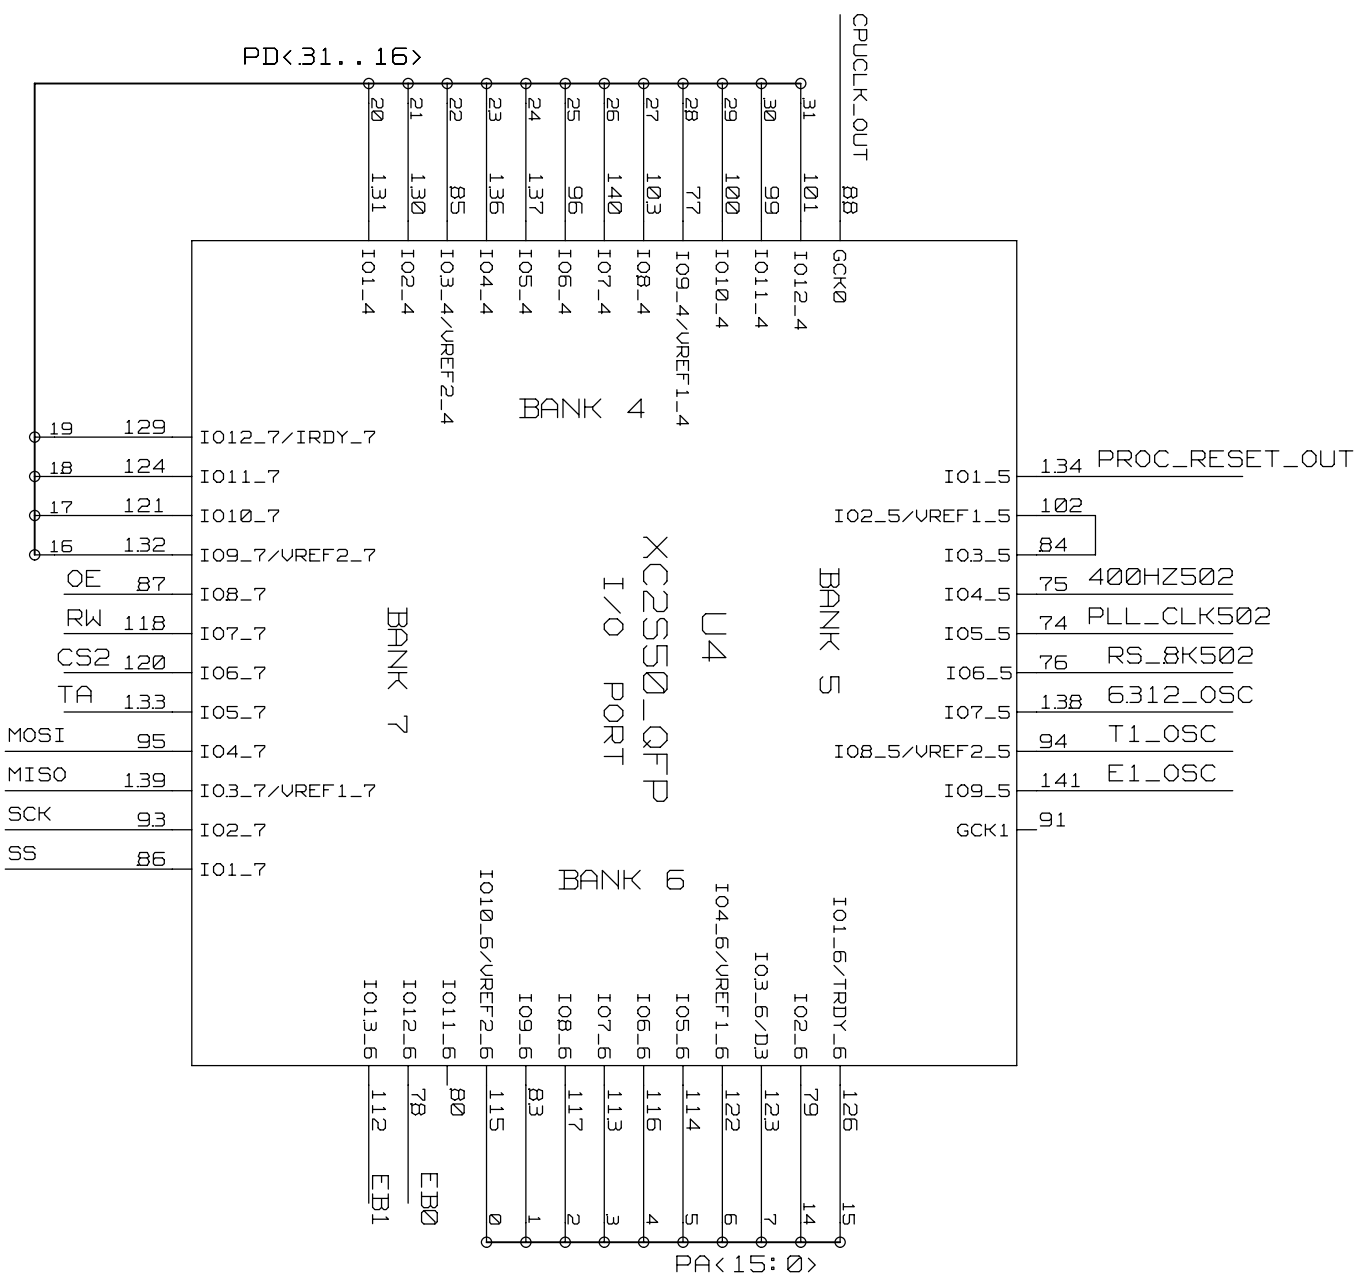

NOTE: BOARD REVISIONS DS26502DK01A0 AND DS26502DK01B0 DO NOT USE THE CORRECT PIN NUMBERS ON THE RJ48 CONNECTOR (REFERENCE DESIGNATOR J9). THE RJ48 CONNECTOR SHOULD BE REMOVED SINCE IT HAS NON-STANDARD CONNECTION. THE SCHEMATIC HAS BEEN UPDATED AND IS CORRECT.
